Update: 08.02.2020 from Computer Hope Code can refer to one of the following: 1. Code (abbreviation of source code) is a term used to describe a written text using the protocol of a particular language by a programmer. Examples of programming languages are C, C#, C++, Java, Perl and PHP. The code can also be used in a less formal way to refer to written texts for markup or styling languages, such as HTML and CSS (Cascading Style Sheets). For example, you might see people refer to the code in many languages, such as 'CODE', 'PHP code', 'HTML code' or 'CSS code'. An example of a C# scripting code that prints Hello, World! "On screen" is shown below. `public class HelloWorld { public static void Main() { System.Console.WriteLine("Hello World!"); } }` Below is an example of Perl scripting code that prints "Hello World!" on screen. `usr/bin/perlprint "Hello World!";` Related Pages 2. When you write in HTML, the tag is used to designate that a text section is computer code. 3. When describing a hardware identification number, a code may refer to a serial number or a model number. With the software, a code can refer to the CD key or activation code. Code name, computer abbreviations, programming deadlines, source code As web developers we all love to program; that's why © We do what we do. I guess we all try to be the best we can. Working in the frantic environment of BKWLD, our team of developers must learn to adapt at the moment to meet deadlines, most of which arrive a little faster than we would like. I often have to try to find a line of demarcation between doing something right and doing it quickly. The expectation is that both can be reached, which is sometimes true. Most of the time, however, they are not. To lean more on one side, choosing to make something clean and beautiful, or to realize something complete when the customer needs. What approach is better? Our technical director, Justin Jewett, the summary. summary. Especially when he said to me, "We need fewer killers and more street fighters", Jewett points out that we need people who know how to program fast, handle fists and do the best possible job à which is especially difficult when things get heated and clients are not friendly. This has led to many intense discussions about which approach is correct. Poetry is Good There is a reason why good code is considered a form of poetry. It's stylish, clean, easy to read and fun to write. These are all exceptional qualities that we should strive for every day. This approach is philosophically correct. If the code is well structured from the beginning to the end of the game, things are easier to find and modify. For example, creating a JavaScript file that contains all the configuration-level variables is a good practice, making it simple to make changes such as the speed of animation and the length of delays. Speed is good Speed is often overlooked and/or discussed among developers. The simple way of doing things is often seen as mean or amateurish. Shortcuts and hacks are further disapproved, and their practitioners are considered by the community as bad developers. I am a proponent of rapid development for many reasons, the first of which is to get things done on time à or soon. This leaves more room for polishing and can make both manufacturers and customers very happy. Creating a framework certainly speeds up development and makes things faster, but not everything fits into a clean, packaged convention. There are times when a simple image tags, tables, or even (may I say?) frames, quickly solve a problem that would take much longer to build using standards or an innovative new workflow. I worked on sites that were too complicated for their needs and context. Not everything. Complicated environments, Python framework, or concatenated scripts minimized with cache-busting hash. All these things have their place for specific projects, but a good developer has to choose is better for the project application field, rather than use only the most complex technology in all cases. Find what is right for the project When you consider the project you are working on, think about what needs are and where most of the time should be spent. For example, if the site does not need complex JavaScript, then don't add a script loading framework and modules that will take time and energy to configure. Instead, a simple script file or even some online JavaScript will work well. This way, the requirements are met and you can spend more time on the rest of the site. If the project is a personal project that passionately fascinates you, use all the time you want to be sure that each line of code is where it should be and is reduced to its cleanest form possible. If the project is for a three-month campaign that must be completed next week, the shortest route to the finish line is probably the best. I've been a developer only for five years, and 95 percent of my professional projects are the last. We must complete quality work as quickly as possible. Matt Aebersold Matt Aebersell is a developer of BKWLD. This article originally appeared in the number of net magazines 246. Did you like it? Read these! What is your code philosophy?
