The grid contains an X axis and a Y axis that are truly two perpendicular lines. A trick to remember this \\\(and yes, many students often forget that it is that\\\) is to think about y as the longest letter so it will always be the vertical line on the axis. X is the horizontal line on the axis. However, if you have a different make-up to remember the X and Y axis, use what works for you. The point where the X axis and the intersection of the Y axis are indicated as origin. You will also see the grids indicated as the Cartesian coordinates. The numbers for tracking points are indicated as or \\\(2.2\\\) etc. The first number means that it starts on the X axis and move that many through, the second number is the number on the Y axis. Therefore, for the ordered couple \\\(3.5\\\) I would have crossed 3 and five. There are actually four quadrants on the grid when 0 is the center of the grill. This allows tracking of positive and negative integers. The entire negative will fall to the left of the axis from where Two perpendicular lines intersect and will also fall below intersecting perpendicular lines on the Y axis. This is just a brief overview of such as the Cartesian grid or coordinate worksheet tracing lines work. With a small practice, you will understand the concept in no time.
