Install a file manager (such as Cx File Explorer or File Manager) so that you can find the APK file after downloading it to your phone. Download the APK file, open it and install it. Or transfer the APK installer from your computer via USB. If you want to use the app outside the Google Play Store, you can install the app's APK file. This article explains how to install APK files on Android 7 or later. Before you can download APK files using Chrome or another browser, you must first enable unknown apps: open your device's settings and tap Apps & notifications (or Apps on older versions of Android). Tap the three dots in the upper right corner. Tap Special Access. Tap Install Unknown Programs. Click Chrome (or whatever web browser you're using) Move Allow from this source to On. Now that your phone has been configured to allow installation of unknown apps, you will need a way to find the app file (APK file) on your phone to get it working. Android phones usually have a file manager app you can use, but if you don't have one, search Google Play for one of the best file managers for Android. For example, you can download Cx File Explorer or get a file manager. the easiestTo install the APK file on your Android device, you need to download it using your default Chrome browser. Find the website that offers the Android app and tap the link to download the APK file. Accept all pop-ups including "This file type may damage your device". Only download apk files from reputable sources. A quick Google search can often tell if an app (or the company that makes it) has a dubious reputation. If your phone's web browser doesn't let you open the file after you download it, open the file browser, open the Downloads folder on your device, then tap the APK file. Grant the app all necessary permissions. Then tap Install at the bottom of the installation window. You will now see the available application in the list of installed programs. If your phone doesn't have internet access, or you can't use your browser to download a file for some other reason, you can still install apps from your computer. Download the APK file using your computer's web browser as above. Once downloaded, connect to your Android phone and upload the file. If you have never connected your Android device to a computer, enable USB debugging mode on Android. Then you can connect your phone to your computer with a USB cable and it will be mounted on your phone as a flash drive. When your phone is connected to your computer, it will appear as a different drive in your computer's file explorer. Move the APK file downloaded from the application's website to the /sdcard/download folder of your phone. After uploading the file, use the File Explorer app on your phone as described in the previous section to tap on the APK file and install the app. If you don't have a USB cable, another solution is to install Google Play's Wi-Fi FTP server. Then use a free FTP client software on your computer (for example, download FileZilla) to transfer the APK file from your computer to the phone's /sdcard/download folder. However, it has been improvedand requires an understanding of how to use FTP files. If the APK installer doesn't launch when you click it, there is an advanced workaround that might work. You can install the APK file on your Android using Minimal ADB and Fastboot from your computer. Connect your phone via USB and enable USB debugging. Download Minimal ADB and Fastboot on your computer and then install them. Run the tool and a command window will open. When the phone is connected to the computer with a USB cable, type the adb device command. When the tool detects your phone, the device ID will appear in the list of connected devices. You can now transfer the APK file. Use Windows Explorer to locate the downloaded APK file on your computer. Right-click the file and select Copy. In Windows Explorer, navigate to the Minimal ADB and Fastboot folder (usually c:\Program Files (x86)\Minimal ADB and Fastboot\). Put the APK file in this folder. Rename the APK file to something short so it can be easily entered as a command. In the same command window you opened earlier, type adb install application name (replace it with the APK file name). If you see the word Success, the app is installed on your phone. APK (Android Package Kit) is a type of file that installs an Android application. It is like an executable file (EXE) for Windows or a package installer (PKG) for Mac. If you've ever installed an Android app from the Google Play Store, then you've used an APK file without realizing it. When you click the "Install" button, Google Play will automate the process of transferring the APK file to your phone and do it for you. If the Android app you want to install is not available on Google Play, you can download the APK file from the Internet and install it manually. There are many websites where you can find non-Google Play apps to install. For example, visit Apk Pure, Reddit's apk directory, or APKMirror. FAQ Can APK files damage your Android? Maybe.An online download may contain a virus, so it's important to only download APKs from secure sources. Can I delete APK files on my Android? Yes. APK files are only used to install apps. After installing the app, you can delete the APK file. What is ConfigAPK in Android? ConfigAPK comes pre-installed on Android devices. Used to run APK files and install apps.
