Skip to content How-To Geek is where you turn when you want experts to explain technology. Since we launched in 2006, our articles have been read more than 1 billion times. Want to know more? Your Windows 7 PC might not be compatible with some applications, you might want to run more than one operating system, or you could be itching to test software without affecting your system. When you want to create a virtual machine on Windows 7, the process is simple and straightforward. Instructions in this article apply to Windows 7. To create a virtual machine in Windows 7, you must first install Windows Virtual PC from the Microsoft website. Make sure your computer meets the system requirements before proceeding: Windows 7 with an Intel, AMD, or VIA processor capable of hardware-assisted virtualization, with the setting turned on in the BIOS. 2GB of memory (recommended). 20MB of free hard disk space. Go to the Windows Virtual PC download page in your web browser. Select an alternate language if desired, then select Download. Select the checkbox for the download version you want. You can choose either the 64-bit version (x64) or 32-bit version (x86). Select Next to download Windows Virtual PC. Open the download file to begin the installation. Select Yes on the Windows Update Standalone Installer window to begin the installation. Read the license terms and select I Accept if you agree to the terms. Wait while updates are installed. Select Restart Now on the Installation Complete screen to restart the computer and continue creating a Windows 7 virtual machine. Be patient; the configuration process might take several minutes. When the computer restarts, select Start and enter "virtual" in the Start Search box. Select Windows Virtual PC when it appears under Programs. The Virtual Machines folder will open. Select Create Virtual Machine at the toolbar at the top of the folder. The Create a Virtual Machine dialog box will open. Enter a name that will help you identify the virtual machine in the Name field. Select Browse and navigate to the location in which you want to store the virtual machine file or leave the default location that is already entered. Select Next to continue. Enter the amount of RAM memory you want to assign to the virtual machine. This will depend largely on the requirements of the operating system you want to install on the virtual machine. The amount you can specify will be listed beneath the RAM box. Select the Use Computer Network Connections checkbox if you want to connect the virtual machine to an external network. If not, clear the checkbox. Select Next to continue. Create a virtual hard disk to which you will install the operating system you intend to use. Choose between a dynamically expanding virtual hard disk, which will expand to meet your virtual machine space requirements, an existing virtual hard disk, for which you will need to navigate to add the location, or use advanced options. If you select Advanced Options you can choose to create a dynamically expanding hard disk, a fixed-sized hard disk, or a differencing hard disk. Select the location for the virtual hard disk, enter the name for it, and choose Next. Select Create to complete the creation of your Windows 7 virtual machine. You can now go back to Windows Virtual PC via the Start menu again to access your new Virtual Machine in the Virtual Machines folder. Right-click the name of the machine, select Settings and navigate to the drive containing the installation disk of the operating system you want to install and use. Thanks for letting us know! Tell us why! Although it might not be dangerous, bloatware does consume hard drive space that could be used by more meaningful applications. It could slow your system speed, as well. Fortunately, you can remove Windows 10 bloatware without much time or effort. Instructions in this article apply to Windows 10. There are a few different types of bloatware that are pre-installed on new computers. Trialware is software your new PC includes free to use for a specific trial period, such as 30 days or 6 months. 8vFanl / Getty Images A full version of the software is commonly installed on the computer, even if only certain features are available to use during the trial period. When the specified time runs out, the program loses functionality unless and until you purchase a license. However, the software sticks around on your computer. Applications created by the computer manufacturer are another common source of bloatware. You might find some of these programs useful, but others might never see the light of day. The most dangerous type of bloatware that your Windows 10 computer could include is adware, which might cause popups, spyware, or worse. If you know what applications you want to remove, uninstalling them from Windows Apps & Features is a straightforward way to do so. Log in to the computer as an administrator. Type apps into the Windows 10 search box. Select Open on Apps & Features from the list of search results under System Settings. Choose Name, Size, or Install Date in the Sort By list. If you want to find apps that came pre-installed on your computer, sort by the date installed. Scroll to the bottom of the list, as the most recently installed applications will be displayed at the top of the list. Select an application you want to remove. Research any applications you're not sure about to determine whether they're necessary programs you should keep or bloatware you could safely uninstall. Should I Remove It? is a helpful resource to decide what to keep and what to remove. The site uses crowdsourced data to provide recommendations as well as information about a plethora of applications. Select Uninstall. Confirm you want to uninstall the program and wait until the process is complete. Repeat for each application you want to remove. PowerShell is a command and scripting language. You can use it as a tool to simplify and automate tasks, such as hiding or removing Windows 10 bloatware. First, you must decide what you want to uninstall. Then you can run PowerShell as an administrator and enter commands to remove the applications. Type powershell into the Windows search box. Select Run as Administrator in the search results. Choose Yes if a user account control window appears. The PowerShell window will open. Enter DISM /Online /Get-ProvisionedAppxPackages | select-string Packagename to access a complete list of installed apps. Enter DISM /Online /Remove-ProvisionedAppxPackage /PackageName:PACKAGENAME replacing PACKAGENAME with the app you want to uninstall. Repeat for each app you want to remove. Another option is to use a third-party uninstaller to remove unwanted bloatware in Windows 10. These programs are especially helpful for applications that don't have a straightforward uninstallation process or those that will not uninstall completely. Although it's often pre-installed when you purchase a new computer, there are times when you might be adding it to your system without even realizing it. Knowing what to watch for and how to steer clear of it could help you prevent issues in the future. Free software is often bundled with bloatware. Pay attention to the fine print and extra checkboxes, which are often selected by default, when you install a new program. Opt out from any extras unless they provide value that you need and want. If you cannot opt out of extra apps, reconsider downloading the software you intended to install. There could be a safer, less bloated alternative available. Thanks for letting us know!
