Diseases transmitted through water

What is the type of mode of transportation when diseases are transmitted through water. Describe 4 diseases which are transmitted through food and water. Describe four diseases which are transmitted through food and water. Which of the following diseases is not transmitted through contaminated water. What diseases can be transmitted through drinking water supplies. Mention six diseases which are transmitted through food and water. Diseases transmitted through drinking water supplies. Diseases which are transmitted through contaminated food and water.

Transmitted infection through human sexual behavior "Sexual disease" redirects here. It should not be confused with sexual dysfunction. Typical condition transmitted infection, another disease transmitted by namesexually transmitted (STD); Vené Rea (VD) "Suffilis is a dangerous disease, but can be healed." Poster encouraging treatment. Published between 1936 and 1938.Sespecialty doesSmptomnone, Vaginal discharge, penile discharge, ocleras in or around the genitals, POR LVICA PAIN [1] Complicationsinfertility [1] CausesInfectivalls Having sex, vaccinations, condoms [2] Frequency .1 billions (different HIV / AIDS cities, 2015) [3] HIV / AIDS Mortes108,000 (STIS), 2015) [4] Sexually infections transmissible (ISTS), also referred to as sexually transmissible diseases (STD) and the oldest venecy disease, are infections that are spread by sexual activity, especially vaginal relationships, Anal sex and oral sex. [1] [5] Cutly do not cause symptoms initially, [1], which results at risk of transmitting infection to others. [6] [7] Symptoms and signs of ISTS may include vaginal discharge, penile discharge, alcera or around the genitals and pain. [1] Some STIS can cause infertility. [1] Bacterial ISTS include clamity, gonorrhé and sophilis. [1] Viral ISTS include genital herpes, HIV / AIDS and genital warts. [1] St. Parasites include trichomoniasis. [1] Diagnostic tests STI are generally easily available in the developed world, but they are often unavailable in the developing world. [1] Some vaccines can also decrease the risk of certain infections, including hepatitis B and some types of HPV. [2] Safe sexual practices such as the use of condoms, having a smaller number of sexual partners, and being in a relationship in which each person only has sex with the other also reduces the risk of STIS. [1] [2] Comprehensive sexual education can also be useful. [8] Most ISTS is treated and curable; Of the most common infections, suffilis, gonorrhé, clamity and trichomoniasis are curricable, while HIV / AIDS is not curable. [1] In 2015, about 1.1 billion people had HIV / AIDS. [3] About 500 million were infected with suffilis, gonorrhé, clamity or trichomonasé. [1] At least an additional 530 million people have genital herpes, and 290 million women have human papillomavirus. [1] HIV istos resulted in 108,000 deaths in 2015. [4] In the United States, there were 19 million new cases of STIS in 2010. [9] Stis's historical documentation dates back to at least The papyrus Ebers around 1550 BC and the Old Testament. [10] There is often shame and stigma associated with STIS. [1] The term sexually transmitted infection is usually preferred on sexually transmissible diseases or venous disease since it includes those who have no symptomatic disease. [11] Signs and Symptoms This section needs expansion. You can help by expanding it. (July 2018) Not all ISTS are symptomatic, and symptoms may not appear immediately after infection. In some cases, a disease can be transported without symptoms, which leaves a greater risk of passing the disease to others. Depending on the disease, some untreated ISTS can lead to infertility, pain or death death. [12] The presence of a STI in children prepared-pagas can indicate sexual abuse. [13] Cause Transmission A sexually transmissible infection present in a graceful woman can be passed to the baby before or after birth. [14] risk of transmission by unprotected sexual act with an infected person [15] [16] [17] [19] [20] [21] [21] [23] [26] [26] [26] [26] [26] Possible known risks performing oral sex in a man clamity throat [15] Gone throat [15] (25 Å € € 30% HERPES (rare) HPV [16] Sophilis [15] (1%) [17] Hepatitis B (low risk) [18] HIV (0.01%) Hepatitis C (unknown) performing oral sex in a woman HPV [16] Gone throat [15] Canyon Cellany [15] Receiving Oral Sex - Man Chlamydia Gonorrhéia [15] Herpes Sifilis [15] (1%) [17] HPV receiving oral oral Herpes HPV Bacterial Vaginosiis [15] Gonorrma [15] Vaginal sex Å € à € "Chlamydia man (30 Å à € 50%) [18] Crabs Scabies Gonorrma (22%) [20] Hepatitis B Herpes (0.07% for HSV-2) [21] HIV (0.05%) [19] [21] HPV (high: around 40 Å € 50%) [22] Infection By mycoplasma homines [28] [30] [31] [31] MicoPlasm genitalium [33] [33] [33] 34] [33] 34] [35] Tricomon's Ureathma infection of the Sofilis [36] [37] [32] Vaginal sex of hepatitis C Å € à € "Chlamydia woman (30 Å à € 50%) [18] Crabs Scabies Gonorrma (47%) [23] Hepatitis B (50) Å € 70%) HIV Herpes (0.1%) [19] HPV (high: [18] around 40 Å € € 50%) [22] Mycoplasma Hominis infection [22] [29] [29] Uraplasm of Sophilis Tricomonåsé [32] [37] [37] [37] [37] [37] Hepatitis C Anal Sex Å € à € "Inserted Chlamydia Crabs Scabies (40%) Gonorrhé ia hepatitis B Herpes HIV (0.62%) [25] HPV Sophilis (14%) [17] Hepatitis C Anal Sex Å € à € "Chlamydia Crabs Receptive Scabies Gonorrhéia Hepati TE B Herpes HIV (1.7%) [25] HPV Sophilis (1.4%) [17] Hepatitis C Ailingus Amoebasis Cryptosildiosis (1%) Giardiasis [38] Hepatitis A [39] (1%) Shigelose [40] (1%) HPV. (Note: hepatitis A and hepatitis and are transmitted through fecal-oral pathway; hepatitis C rarely is sexually transmitted), [50] and the hepatitis D transmission route (if infected with B) is uncertain, but may include sexual transmission. [51] [52] [52]) Herpes Simplex (Virus 1, 4) Skin and mucosal, transmissible with or without HIV visible bubbles (human immunodeficiency VERRUSS) - Venely real fluids, Simen, Breast milk, HPV of blood (human papillomavirus) - Contact with skin and mucosa. The types of HPV " High risk "cause almost all cervical cans as well as some anal, penile and vulvar cans. [54] Some other types of HPV cause genital warts. Molsucum contagiosum (Moluscum contagiosum virus mcv) Å € € "CLOSE CONTACT [55] Virus Zika [56] Parasites Crab lice, colloquially known as "crabs" or "pubic lice" [57] [59] The Inflamed Infestation Follow-up is the pediculose pubis trichomoniasis (Sarcoptes Scabiei), trichomoniasis (vaginal tricomonas), colloquially known as main sexually transmissible infections include: clamity is a sexually transmitted infection caused by bacteria Chlamydia Trachomatis. In women, symptoms may include abnormal vaginal discharge, burning during micro and bleeding between the peroxies, although most women do not experience any symptoms. [60] Symptoms in men include pain to urinate and abnormal discharge of the penis. [61] If it is not treated in men and women, clamity can infect the urinary tract and potentially lead to the inflammatory disease (PID), PID can cause serious problems during pregnancy and even the potential to cause infertility. It can cause a woman to have a potentially mortal ectopic pregnancy, in which the egg implanted out of the tube. However, clamity can be cured with antibiotics. The two most common forms of herpes are caused by infection by Virus Herpes Simplex (HSV). HSV-1 is typically purchased orally and causes cold sores, HSV-2 is usually acquired during sexual contact and affects genitals, however, tension can affect any site. [62] Some people are asymptomatic or have very light symptoms. Those who experience symptoms usually the 2 to 20 days after exposure that lasts 2 to 4 weeks. Symptoms may include small bubbles full of liquid, headaches, ritions, itching or tingling sensations in the genital or anal area, pain during the mic, flu as symptoms, swollen glames or fever. Herpes is Through skin contact with a person infected with Virus. Virus affects the areas where it entered the body. This can occur through kisses, vaginal sexual intercourse, oral sex or anal sex. Virus is more infectious during times when there are visible symptoms, however, those who are asymptomatic still can spread the virus through skin contact. [63] The initial infection and symptoms are generally the most serious because the body does not have accumulated antibodies. After the primary attack, you can have recurring attacks that are smoother or may not even have future attacks. There are no healing for disease, but there are antiviral medications that treat your symptoms and decrease the risk of transmission (VALTREX). Although HSV-1 is typically, the "oral" version of the Virus, and HSV-2 is typically the "genital" version of the Virus, a person with HSV-1 orally can transmit this virus to their genital partner . Virus, any kind, will settle in a nervous package at the top of the column, producing the "oral" outbreak or a second nerve package at the base of the column, producing the genital outbreak. Human papillomavirus (HPV) is the most common STI in the United States. [64] There are more than 40 different HPV wirts and many do not cause health problems. In 90% of cases, the body's immunological system cleans the infection of course within two years. [65] Some cases may not be erased and can lead to genital warts (collisions around the genitals that can be small or large, raised or plans or molded as a caption of the use of the use of the surge and other cans related to the Cervico. The symptoms may not appear to the advanced steps. It is important that women do the papycolal stains in order to check and treat the cans. There are also two vaccines available for women (Cervarix and Gardasil) that protect against the types of HPV that cause cervical câms. HPV can be passed by genital-a genital contact, as well as during oral sex. The infected partner may have no symptom. The gonorrhé was caused by bacteria who lives in mucous membranes in the urethra, vagina, straight, mouth, throat and eyes. The infection can spread through contact with the penis. Vagina, mouth or es € nus. The symptoms of gonorrhé generally appear two to five days after contact with a partner Infected, however, some men may not notice symptoms by up to a month. Symptoms in men include burning and pain during urinating, increased urinary frequency, pulse diffusion (white, green, or yellow in color), red or swollen urethra, swollen testicles or contests, or sore throat. Symptoms in women may include vaginal discharge, burning or itching as they urinated, painfully sexual sexual, severe pain in the lower abdomen (if the infection spreads to the speaking tubes), or fever (if the infection spreads to the False Tubes). However, many women do not show any symptoms. [66] Heavy duty antibiotic strains of gonorrhé is a significant concern, but most cases can be cured with existing antibiotics. Syphilis syphilis syphilis is a sti caused by a bacterial. Not treated, can lead to complications and death. [67] Clinical manifestations of suffilis include the ulceration of the urogenital tract, mouth or rectum; if it is not treated, the symptoms worsened. In the last years, Sophilis prevailing decreased in Western Europe, but increased in Eastern Europe (former Soviet states). A high incidence of suffilis can be found in places like Camerams, Cambodia, Papua New Guinea. [68] Sofilis infections are increasing in the United States. [69] Trichomonis is a common STI that is caused by infection with a protozoa parasite called Vaginalis Trichomonas. [70] Trichomonias affects women and men, but symptoms are more common in women [71] Most patients are treated with an antibiotic called metronidazole, which is very effective. [72] HIV (human immunodeficiency virus) undermines the immune system of the body, which in turn is its ability to combat agents causing diseases. Virus kills CD4 cells, which are white guts that help fight multiple infections. HIV is performed on bodily fluids and is distributed by sexual activity. It can also be transmitted by contact with infected blood, breastfeeding, childbirth and mother for child during pregnancy. [73] When HIV is in its most advanced phase, an individual is said to have AIDS (acquired immunodeficiency resembance). [74] There are different phases of the progression of HIV infection and. The steps include primary infection, asymptomatic infection, symptomatic, and AIDS infection. In the primary infection phase, an individual will have flu-like symptoms (headache, fatigue, fever, muscle aches) for about 2 weeks. In the asymptomatic phase, symptoms usually disappear, and the patient can remain asymptomatic for years. When HIV progresses to the symptomatic phase, the immune system is weakened and has a low CD4 + Squire Cland Count. When HIV infection becomes life-threatening, it is called AIDS. People with AIDS are vindictures of opportunistic infections and die as a result. [60] When the disease was first discovered at the DA © Each of 1980, those who had AIDS were not likely to live longer than a few years. There are currently antiretroviral drugs (ARV) available for the treatment of HIV infections. There is no known healing for HIV or AIDS, but drugs help suppress virus. By suppressing the amount of viruses in the body, people can lead longer and healthier lives. Even though your verrus levels can be low they can still spread the virus to other people. [75] Virus in twenty-seven different types of series virus were identified in the SÅvmen. Information on whether or not the transmission occurs or if the virus disease causes it uncertain. Some of these micros are known to be sexually transmitted. [76] Pathophysiology Many STDs are (more easily) transmitted through the mucous membranes of the Panis, Vulva, the rectum, of the urinary tract and (less ofenan € States. [69] Trichomonis is a common STI that is caused by infection with a protozoa parasite called Vaginalis Trichomonas. [70] Trichomonias affects women and men, but symptoms are more common in women [71] Most patients are treated with an antibiotic called metronidazole, which is very effective. [72] HIV (human immunodeficiency virus) undermines the immune system of the body, which in turn is its ability to combat agents causing diseases. [69] Trichomonis is a common STI that is caused by infection with a protozoa parasite called Vaginalis Trichomonas. [70] Trichomonias affects women and men, but symptoms are more common in women [71] Most patients are treated with an antibiotic called metronidazole, which is very effective. [72] HIV (human immunodeficiency virus) undermines the immune system of the body, which in turn is its ability to combat agents causing diseases. Virus kills CD4 cells, which are white guts that help fight multiple infections. HIV is performed on bodily fluids and is distributed by sexual activity. It can also be transmitted by contact with infected blood, breastfeeding, childbirth and mother for child during pregnancy. [73] When HIV is in its most advanced phase, an individual is said to have AIDS (acquired immunodeficiency resembance). [74] There are different phases of the progression of HIV infection and. The steps include primary infection, asymptomatic infection, symptomatic, and AIDS infection. In the primary infection phase, an individual will have flu-like symptoms (headache, fatigue, fever, muscle aches) for about 2 weeks. In the asymptomatic phase, symptoms usually disappear, and the patient can remain asymptomatic for years. When HIV progresses to the symptomatic phase, the immune system is weakened and has a low CD4 + Squire Cland Count. When HIV infection becomes life-threatening, it is called AIDS. People with AIDS are vindictures of opportunistic infections and die as a result. [60] When the disease was first discovered at the DA © Each of 1980, those who had AIDS were not likely to live longer than a few years. There are currently antiretroviral drugs (ARV) available for the treatment of HIV infections. There is no known healing for HIV or AIDS, but drugs help suppress virus. By suppressing the amount of viruses in the body, people can lead longer and healthier lives. Even though your verrus levels can be low they can still spread the virus to other people. [75] Virus in twenty-seven different types of series virus were identified in the SÅvmen. Information on whether or not the transmission occurs or if the virus disease causes it uncertain. Some of these micros are known to be sexually transmitted. [76] Pathophysiology Many STDs are (more easily) transmitted through the mucous membranes of the Panis, Vulva, the rectum, of the urinary tract and (less ofenan € States. [69] Trichomonis is a common STI that is caused by infection with a protozoa parasite called Vaginalis Trichomonas. [70] Trichomonias affects women and men, but symptoms are more common in women [71] Most patients are treated with an antibiotic called metronidazole, which is very effective.
