Only in the 'case' of having been hibernating for the last few days, the development of the system remains evolving, and the technological tools that allow the development of the system are evolving well. 'Case' in question: The use of Computer Aided Software Engineering (Case) tools is becoming more common for all phases of system life cycle (SDLC). These include data modeling tools, analysis and design specification tools, user interface prototyping tools and code generation tools. Without wanting to enter your 'case', but if your line of work involves the development of the system, especially the development of large-scale systems, then the 'case' was made for the use of CASE tools. What is a case of tools? Just what is a case tool? There are numerous definitions. In general, CASE can be defined as part automation or the entire system development process. What began as "Paper and Pen" based methodologies have evolved over time in CASE tools with the development of graphic workstations and personal computers. Case tools are computer-based products that support or more phases within the SDLC. These tools help reduce or eliminate many of the problems of design and development inherent to projects produced by manuals. They are not integrated case tools, (i-case), front-end tools and back-end (LOWER) tools. Depending on the scene and dimension of the project, either one of the tools or a tool combination can be used. I-Case Tools Support all phases of the development lifecycle and make it organized, allowing the integration and sharing of data between the tools. The number of an I-Case tool is a shared dictionary / repository and can be accessed by the strategy and analysis tools, design tools and construction tools and maintenance O. The repository stores the knowledge of the multiple tools in an integrated way, and is accessible to all tools throughout the development life cycle. Top tools are designed for the initial phases of SDLC, and are used for project planning, system analysis and overall systems design. Superior Case Help Tools Diagram and set the current system and the proposed system and these include requirements and design support tools. Minual tools are designed for SDLC back-end and are used à € à €
