## Down syndrome chihuahua

Down syndrome dog chihuahua. Down syndrome chihuahua for sale. Can chihuahuas have down syndrome.

Reye or RS syndrome is a progressive disorder characterized by brain and liver damage. RS causes enormous fat deposits in the liver and other organs. The Australian Douglas Reye pathologist produced the first detailed analysis of Reye syndrome in 1963. Å »RS strikes less than one on one million children every year and is almost never seen in adults. Those who develop Reye syndrome tend to experiment with very mild symptoms with complete recovery. However, the disturbance can be fatal or cause long-term difficulty for children and adolescents. Reye's syndrome follows a progression of five phases for several hours or days. The first symptoms are vomiting and irritability, followed by a skin eruption on the palms of the hands and soles of the feet, confusion, headache, combativity or lack of energy. Vomiting quickly becomes persistent and serious, even if the child does not eat or drink anything. Renfoto / Getty Images Two phase symptoms Two symptoms include rapid breathing, hyperactive reflections, a state of almost unconsciousness and fat liver. Phase three brings the growing gravity of phase one and two symptoms. At this point, patients also develop cerebral edema or brain swelling due to excess liquids; This can lead to a coma. Respiratory arrest is a concern in stage three, even if it is rare. Milano Jovic / Getty Images Stage Four of Reye's Syndrome involves a deeper coma and pupils dilated with a small reaction to light. The liver dysfunction gets worse and fat begins to build in more organs. The five stage progresses quickly from the four stage. Convulsions, multiple organ failure, Å ¸ and weak or paralyzed limbs can accompany the coma. Step five extremities with hyperammemia, an excessive ammonia in the blood. Toxins accumulate throughout the body at this point, due to the liver and renal dysfunction. HRAUN / GETTY Images The cause of Reye syndrome is not known. RS usually occurs shortly after recovery from a viral disease like chickenpox or flu, although it can start from three to five days after the onset. Researchers connect about 90% of cases in children to salicylated drugs. Exposure to chemicals such as diluents of paint and herbicides can also increase the risk of developing RS. RyanJlane / Getty Images Metabolism metabolism errors include a wide range of genetic disorders that interfere with metabolism, usually through defective genes related to enzymes. The initial symptoms of different congenital mistakes of the metabolism are swelling of brain dysfunction and liver. Many children and adolescents with RS have an oxidation disorder of underlying fatty acids that interferes with the break of fatty acids. When doctors suspect RS, they should also evaluate their patients for errors Shunyufan / getty images The most serious symptoms of Reye syndrome come from damaged cell mitochondria. The salicylates in drugs can exacerbate mitochondrial damage. Children and teenagers should not take drugs containing Without first consult a doctor. The CDC recommends children under 19 to avoid salicyles. Sometimes the presence of salicylates in drugs is not evident, so the best practice is to review the ingredients of all drugs before giving them to children. PeopleMages / Getty Images Reye's syndrome is rare, so diagnosis involves the exclusion of other pathologies with similar symptoms. These conditions include meningitis and encephalitis, which cause inflammation of the brain, spinal cord, or protective membranes. Tests for some chemicals are made to exclude or confirm known metabolic disorders. The TAC shows swelling in the brain while a lumbar puncture allows doctors to obtain a spinal liquid sample to test infections or anomalies. Blood and urine analysis measures the accumulation of toxins and details on hepatic functionality. LUOMAN / GETTY Images The treatment of Reye syndrome is supportive and usually takes place in an intensive care department. Early diagnosis is essential, and the treatment focuses on the protection of the brain from irreversible damage. Secondary priority of the treatment are inverting metabolic abnormalities, prevent respiratory complications, and anticipate cardiac arrest. Steroids Relieve brain swelling, and hypertonic glucose IV solutions can help during the final stages of RS. FLUYDUST / GETTY Images The recovery from Reye syndrome depends on how swelling has occurred in the brain for the duration of the disease. If the doctors identify and deal with the RS immediately, patients can completely recover. The time spent between the onset of the RS and the initial treatment is directly related to the quantity of permanent brain damage. When the RS progresses quickly, and the affected person falls into a coma, the overall prognosis is very scarce. In children Reye syndrome is almost always fatal without medical care. CISEREN / GETTY Images The long-term complications of Reye syndrome derive from brain damage. The most common complications include poor capacity of attention and memory, visual or auditory disorders, language difficulties and language and movement difficulty. Swallowing problems require language therapy, and children may need to consume only thickened liquids and soft texture foods until swallowing does not improve. The people who had RS can fight with daily tasks such as the use of toilets, the bathroom, and dress up. Occupational and physical therapy can greatly improve healing. Fatcamera / Getty Images Among all the dogs of the world, Chihuahua is probably one of the most misunderstood. But, there are many reasons why the American Kennel Club lists these little ones, but nice canines at number 35 on their list of breeds more Although they can be small in stature, the Chihuahua have a lot of personality to remedy. They can be a little stubborn and strong volunteer, but they are smart and affectionate companions that will bring you many years of faithful company. Archaeologists discovered the chihuahua dog's appearance on artifacts lost civilizations all over the world. Although historians disagree on the origins of the race, they are probably the descendants of the dog Techichi, a heavier dog of the ancient Tolteca civilization who lived in central Mexico in the 9th century. At one point, historians believed that dogs could come from China. But the geneticists specializing in canine ancestry say that modern Chihuahua share a type of DNA with that of Toltec company dogs, which indicates that this breed has Mexican roots. The name comes from the Mexican state of Chihuahua. by Bachova / Getty Images One of the most visible aspects of a Chihuahua is its size. As an adult, they should grow between five and eight inches tall and weigh no more than six pounds. Males usually have shorter bodies than females. However, even if the AKC includes them in the toy races category, the Chihuahuas do not seem annoyed. They will resist to much larger breeds if necessary, so owners must pay special attention to protect them from potentially harmful situations. knape / Getty Images The Chihuahua breed has two layers, smooth or long. They can be a variety of colors, including black, blue, chocolate, cervix, cream, red, gold, silver or white. Or, they can be a combination of these colors, with white markings. Some coats are cracked, a single solid color with streaks of another color. Others are zibellines, that is, the hairs have black spikes, with a base color of cervix or silver. Many chihuahua have a black or blue mask, or white marks, cream, cervix, red, or a hem or pattern peeled. – User7565abab 575 / Getty Images Although charming and faithful, Chihuahua has the attitude of a much larger dog. Without guidance, they can take over a house using little more than their rash behavior, their intrepidity and a protective instinct to their favorite human. A Chihuahua only trembles when it's cold. Being shy or afraid is not in their nature. A unique feature of the race is that, outside their best human friend, they prefer to spend time with other Chihuahuas rather than with other races. Kurt Pas / Getty Images While the breed can adapt to a family, single families are generally a better solution. Most Chihuahua tends to bind with one individual in the house, although there are other people with whom they interact every day. Their desire to be close to their main person can become obsessive without proper training. They make a big guard dog because of their protective nature and bark whenever they feel a threat is nearby. Their hearing is ten times more sensitive than the human, so they'll hear the sounds long before humans do it. Giulio Fornasar / Getty Images A book published in 1994the intelligence of chihuahua dogs at a lower level than the average based on the opinions of the judges of obedience. but who is familiar with the race has questioned the accuracy of the low ranking. working dogs like border collies or German shepherds, for example, have greater obedience and workLevels. The motivation of a Chihuahua is to be a devoted companion. The breeders brought them to be dogs from LAP and to develop strong ties with their owners. Their intelligence is instinctive and adaptive, that researchers say is more important. However, it does not mean that some Chihuahua cannot even excel in obedience tests. MyDRAG IGNJATOVIC / Getty Images The Chihuahua is an excellent apartment dog, very little sheds, and requires a minimal care. They take care of very little space. Chihuahua prefers curling up next to their favorite person, rather than running around and devastating in their home. These small canines have a lot of energy, but get tired easily. Because they tend to be stubborn and strong, socializing with people and other dogs is important, starting from the puppy. Daily walks, obedience or agility lessons, and other activities will help prevent behavioral problems and keep them physically in shape. Bigand! Photography / Getty Images Chihuahuas have high metabolism. Foods twice a day with food for quality dogs will keep your Healthy by Chihuahua. However, these tiny dogs tend to become overweight, so the owners should keep an eye on the daily calorie consumption of the animal. As puppies, Chihuahua needs access to food at all times, or will become hypoglycemics, which means that they will experience low blood sugar. State signs are free of list and lack of energy. Hypoglycemia can be a condition of danger of life. Laura / Getty Images One of the main advantages of sharing your life with a Chihuahua is that they have the potential to be around for a long time. These pint sized pets have a life expectancy of 14 to 16 years. But like all races, there are health conditions that occur regularly within the breed. Smaller dogs like Chihuahua tend to have problems with displaced knees caps. Because of their protruding eyes, they are also prone to genetic eye disorders. And, some Chihuahua have a molera, a soft area under the skin of the forehead, where the skull bone plates have failed to merge. A veterinarian can identify the problem through an exam. Ksenia Raykova / Getty Images Some breeders pay a premium price for a super-small Chihuahua. They can be nice, but the AKC does not recognize any size outside the standard breed. Dogs described as Å ¸ Å ¸Timension teacup, weight from two to three pounds, are more fragile and inclined to medical problems, including hypoglycemia. The recognized health challenges, such as eye disorders, which occur in Chihuahua breed can have more serious health implications in these smaller dogs. Treamlarium / getty Images
