barcode\_02 image by Perth from Fotolia.com By: Thomas McNish Updated September 26, 2017 Barcodes are a series of scannable lines and spaces that are used to identify a unique product in a matter of seconds. It's helpful to have barcodes when running a business, as you can keep a more accurate record of your inventory at a much faster rate than counting items by hand. If you have a business and want to start using barcodes, you will need to decide what type of symbols you will use, what type of scanner you will have and how many barcodes you will need. Visit [barcodesinc.com](http://barcodesinc.com) (see Resources). Enter the numbers or text you want to use for the item for which you are creating the barcode. Click on the "Advanced Options" tab. Choose your symbolism (code 39 is the most common non-retail barcode symbolism), the height and width of the barcode, the width of the lines, and the font. Click "Generate Barcode" when you are finished. Click on the image of the barcode you just created. Right-click the image of your barcode in the pop-up window and choose "Save Image As." Name it and choose to save it on your desktop. Double-click on your desktop icon and print the barcodes on some blank labels. Earlier this week, I managed to do something that has usually been impossible in New York City: I didn't take out my wallet for two days in a row, and still managed to pay for food, move around and live my life. I didn't even have to try. New York has traditionally been a cash-operated city. I live in Brooklyn, and many of the local wineries and cafes have long been cash only. That has been changing with the arrival of companies like Square, who provide simple ways for even the smaller ones accept cards and contactless payments. The owner of the breakfast cart on the block from my apartment now has a slot reader on his phone: No more visits to an expensive ATM just to get a bagel. Recently, the city has been experimenting with contactless payment for the The system, which, when it is completely alive, will catapult yourself in the new brave world of ... 2012. It is currently available in a few lines and buses, none of which usually take, but a day, I had some Meetings on that line, and paid my rates with my mule. He was magical. Apple UsA © Apple Pay, Apple's No Contact Payment Technology, to pay some things at the pharmacy, and buy lunch through the Safari web browser on my phone. He had not had to use a card, much less in cash, all day. Experiences seem to be part of an increasing trend led by Apple. The company recently announced an association with several US universities. UU to bring students' identifications to the iPhone. In the same way, I can pay for a burrito or a trip by subway doing tapping to my phone on a pillow, university students, including Duke (CEO Tim Cook's Alma Mater), Clemson, Temple, and Johns Hopkins now You can enter the bedrooms, school gyms, libraries and buildings. They can also load their identification cards with school meal plans. Theoretically, a student in one of these schools could move for days without needing anything more than the iPhone of it. In the gym. Earlier this year, Apple also said he would be working with the MTA, the New York Traffic Authority, to bring payments without contact to the subway system. According to reports, the early testing has been a success, recording the million-time payment payment before the MTA was expected. Although contactless payments have existed during years (the first Android device with no contact technology was published in 2010), it was not until Apple took it seriously that one of the most outdated traffic systems in the PaAs was destined. "SA the trend that seems to have replicated a year after year with Apple. MP3 players had For many years before the iPod, but that device was ahead of the musical industry (together with iTunes); Apple did not produce the first TouchScreen smart phone, but the iPhone stimulated a mobile revolution. Even the wireless load, it has The standard on major Android devices for years seemed to increase in prominence after Apple introduced compatible phones. There is something about Apple that enters a market, which is rarely the first to do so, which tends to cause a tectonic change. It could be, at least in the USA. UU., that Apple has about 40% of the smartphone market share, much more than any smartphone producer. It might also be that Apple is such a massive and profit-generating company that others want to be in any industry that enters. What is the reason Apple seems to position itself uniquely to kill the wallet? He's trying to kill the credit card with Apple Pay and his own digital card. Tickets, boarding passes, loyalty cards and cash cards from the wallet and on the phone have already been brought. How long is it? Outside the university in the real world, there are some obstacles that keep the physical wallet in place. Most restaurants and companies still prefer cash: credit card companies charge transaction fees, and obviously there are no cash payment records, which may prefer some companies. But if credit card companies and payment providers like Plaza can demonstrate how they improve the shopping experience, perhaps even bringing new customers, we may start to see more business jumping on the train without contact. Most people also need to bring their IDs in the portfolios when driving (or leaving). The identification issued by the government will probably be the most difficult thing in the wallet to digitize: in the US. States tend to move slowly, and rely on archaic technology and data management systems. As reported to Joanna Stern of Wall Street Journal, there are some states, such as Delaware and Louisiana, that are experimenting with digital identification. But it is probably a few years before this technology is more accepted and understood by the hounters, the store owners and the average troop. What does it mean Apple could be closer to killing different pocket stick: the keychain. Although most people do not have wireless access with a card on their front doors or unlocked access to so cars, the preference of consumers could boost the adoption of digital technologies much faster than governments adapt to them. And the technology to digitize locks is becoming more common. augot, the smart-lock startup, was acquired by assa abloy, the world's largest lock manufacturer, at the end of 2017, and the company has been slowly planting its technology in all other subsidiaries of its parent company. It will probably not be long before augot technology reaches many new doors, both at home and in the office, and it adapts more and more to existing structures when people realize that they can forget the keys at home and still enter. In the same way, more and more car companies are offering unlocked cars, where the driver only needs to have a keychain in them to open the car doors and start the engine. companies such as tesla, ford and gm are also experimenting with applications that communicate with so cars and unlock them. Is that a good idea? There really aren't too many things that stop the digital portfolio, and there are probably few companies that can achieve this change that apple. but there are also a lot of ethical and security concerns to kill the physical wallet and keys. Many of the technology in the apple ecosystem is not cheap. the lower cost apple watch starts at \$279 and the cheapest iphone (which is three years old) starts at \$449. It's great if students have the option to replace so iphones cards, but not all those attending college can afford these devices. these technologies are often available on lower cost android phones, but they are still expensive devices. There's also theof what replacing cash with digital credit systems does to our society. It is much easier for companies to take tips away from workers who accept digital payments instead of cash. "There's More difficult to help marginalized members of the cashless society. It is also essentially a barrier to entry for anyone who does not have or cannot get a bank account, and a tracking tool for governments, banks and credit agencies for anyone who does. Digital technologies such as RFID (Radio Frequency Identification) and NFC (Near Field Communication), which allow many systems contactless, are not immune to hackers. There are literal step-by-step guides on how to copy key cards and FOB keys online, and contactless terminals with phones interacting are also susceptible. So, there is a very obvious problem: what happens if you need to pay you for something, show someone your ID or enter your building if your phone is dead? It's nice, on some level, to imagine a future where all you need to remember when you leave the house is your phone or look, and Apple certainly seems to be handling us in that vision. But if we've thought through all the possible outcomes of that world, others, if we really need it (just put your keys in your bag, maybe?), you're still willing to debate. debate.
