Unfortunately the process com android phone has stopped after factory reset

(Image credit: Shutterstock) If you own an Android phone, you may have noticed that many of the apps you use all the time do not perform and have been used and many users are reporting frequent anomalous arrests that make it difficult to use the phone. Crashes are common among the apps that show web pages, like Gmail. Watching the status dashboard of the Google workspace confirms that service interruptions have been recorded for Gmail specifically starting from March 23rd. The culprit seems to be a bug supplied with an Android WebView update. Android WebView is a tool that allows developers to integrate web pages in their apps. As such, any app that has Android WebView Integration is probably prone to the crash that occurs. There is still no official solution as of everything, but Google has released a statement on the issue, saying: "We are aware of a problem with WebView that causes some apps on Android to Crash. We are currently working to fully validate the purpose and correction is in progress. "What can I do to solve the bug? As mentioned, no official correction from Google still exists, but it seems that the company is hard a correction. Meanwhile, there are a couple of things you can try to eliminate the bug, or at least do it Falling the accidents less frequently, the first of which was suggested by the Samsung, the US support account on Twitter. To start, enter your settings app and tap the Apps category. When you are in, circles "Android System WebView" and once found, touch the options icon "⋮" in the upper right corner of the screen, then select "Uninstall Updates." This will be the Android WebView rollback to its basic version, thus eliminating the update that was caused crashes.if, for any reason, you can't find Android WebView system in your app settings, "Can alternatively try it on Google Play Store. Once You are on the store page for Android System WebView, just touch Uninstall.Best Samsung Phones: choosing the right galaxy for Youshow plus DealSpored by here "Sa Fun One: There are new Android malware that Round not only Irritant - Thank Pop Announcements - Up "but it is also incredibly difficult to remove from your Android device once you have been infected. I look like this malware a little new "xHelper" malware hit a low number of Android users so far (about 45,000 Symantec estimates), the fact that no one has some clear advice on how to remove it is a worrying. While the probabilities are good that you have not been successful with this malware, given its low installation speed so far - even if it was active since March ... you should still know what it does and how (hopefully) avoids. Does not describe Malwarebytes, Xhelper starts hiding as a normal app using Legitime Spoofing Apps "packages. Once you are on your device, you have not been blocked with an "semi-stealth" version, which drops an xHelper icon unfordestly into your notifications - but no shortcut apps or icons - or to "version "full-stealth", which only notice if you visit the settings> app & notifications> app info (or whatever browsing on your specific Android device) and scroll down to see the installed "xhelper" app.cha what does xhelper? Fortunately, xHelper is not a destructive malware in the sense that it does not record your passwords, credit card data or anything else you are doing on your device and send it to some unknown striker. Instead, it simply sponsored with advertisements to pop-up on your device and annoying notifications looking to make you install more app from Google Play - Presumably as XHelper authors Doing cash from malware. The dark side, as reported by ZDNet, is that xHelper presumably can download and install apps for your account. It doesn't seem so do right now, but if this happens - coupled with the mysterious capacity of the app to persist the past disorder and factory reset - it would be a huge backdoor for Influenced by malware. Dauty, can't I uninstall it? Yes. This is the insidious part of the XHelper. "Symantec Malwarebytes have a good recommendations to get this malware from your device once installed, since the mechanisms used to persist over a complete factory reset of the device are unknown. As Symantec describes: "None of the samples we analyzed were available on Google Play Store, and while it is possible that XHelper malware is unloaded by users from unknown sources, we believe that it may not be the only channel of Distribution. From our telemetry, we have seen these apps installed more frequently on certain telephone brands, which leads us to believe that attackers can focus on specific brands. However, we believe it is unlikely that XHelper is pre-installed on the devices since these apps do not have No indication of being system apps. Furthermore, numerous users have complained about the persistent presence forums of this malware on their devices, despite the execution of the factory restores and uninstalling manually. Since it is unlikely that the apps are apps Systems, this suggests that another harmful system app is persistently unloading malware, That is something we are currently investigating (keep an eye on the threat intelligence blog more on this). "if you think you're infected with xHelper, you can try downloading some standard antivirus apps to your Android device. It is possible that they could help, but wrong by the side of the free antivirus apps for now. Pertesta you find yourself paying a piece of money for an app (or a subscription) that does not actually help you at all. The Xhelper malware is just the eccentric one. I have the full conviction that someone is Google itself or one of the great antivirus players - will find a way to push and remove this malware, but it will take some time to get to that solution. Meanwhile ... How to avoid being affected with XHelper in the first plaiseright now, the best thing you can do to avoid being hit with this type of malware is to be aware of your web browsing habits. Make sure you are redirected to the Sciamy websites that encourage you to extend unknown apps - or apps that appear safely - on your device. In case of doubt, install only app from Google Play Store. Don't sideload apps, as in, not download and install them manually on your device unless you really know what you are doing, completely trusted the app developer and trust the fact that the app that You "Download is actually something safe from the developer who believes it is from. (Although this does not protect you percent percent of the time, attacking it to the Google Play store much more confident than the download of random .apks from the websites you don't know anything.) The Android extensionibility means that we have a wide range of options When it comes to choosing a phone. From the pixels to Samsung experience the user interface on the Galaxy Note 8, the software experience does not crunch with OnePlus 5T or the MIUI MIUI heavily on the skin on the Mix 2, you can get a tailored phone for your preferences. With a so diversified series of available user experiences, it is not rare to see Gremlins pop-up along the way. More often, you can find corrections for problems that commonly affect the phone, but if you can't find a solution, it doesn't hurt to try a rigid reset. A factory reset is also useful if you are trying to sell your device. But before doing it, you should make sure the data on your device are executed the
