Share on PinterestThere's a new dental product that uses your body's natural tooth-forming proteins to rebuild tooth enamel to repair cavities.Why should you care? Well, this process could replace the current method of filling dental cavities... without using a drill.The product was the subject of a research study that was published recently in the journal ACS Biomaterials Science and Engineering.According to the World Health Organization (WHO), cavities are a major public health problem globally and are also the most widespread noncommunicable disease.Dental cavities can seriously impact quality of life.Among other things, cavities may make eating painful and disrupt sleep. When they reach an advanced stage (abscess), cavities may even cause chronic systemic infection.A 2015 study published in the Journal of Dental Research found that cavities affected 2.4 billion people worldwide.In addition, untreated cavities in baby teeth were the 10th most prevalent condition, affecting more than 600 million children globally.Untreated, tooth decay will eventually lead to tooth loss.According to the Centers for Disease Control and Prevention (CDC), tooth decay is the most common chronic disease in American children aged 6 to 11. It is also four times more prevalent than asthma in individuals between 14 and 17 years of age.Dr. Shantanu Lal, director of predoctoral pediatric dentistry and an associate professor of dental medicine at Columbia University Medical Center in New York, told Healthline "Untreated cavities in baby teeth can lead to serious consequences that include pain, learning difficulties, difficulty chewing, poor sleep, missed hours at school, and potentially, life-threatening dental inflammation and infection."Many of the foods we eat cause bacteria in the mouth to create acids.Foods with lots of sugar are well-known sources of plaque, but starches such as bread, crackers, and cereal can also make acids form."Bacteria metabolize sugar and other fermentable carbohydrates in oral environments, and acid, as a by-product, will demineralize the dental enamel," Sami Dogan, a study co-author and associate professor in the Department of Restorative Dentistry at the University of Washington School of Dentistry said in a press release.Bacteria are also responsible for dental plaque that can irritate the gums, making them red, susceptible to bleeding, sensitive, and subject to gum disease.Gum disease can cause the gums to recede from teeth, making pockets that fill with the bacteria that cause infection.Without treatment, bones around the teeth may deteriorate, loosening teeth, and speeding decay.Researchers at the University of Washington School of Dentistry were inspired by how the body's natural tooth-forming proteins work.So, they came up with a method to repair damaged tooth enamel. They captured the essence of amelogenin, the protein needed to form crown enamel, and designed amelogenin-derived peptides (part of a cell that carries out important functions) that can repair tooth enamel.These peptides are the active ingredient in this new treatment. The repair looks just like the mineral structure found in the body's tooth enamel."Remineralization guided by peptides is a healthy alternative to current dental health care," said Mehmet Sarikaya, a lead study author and professor of materials science and engineering and adjunct professor in the Department of Chemical Engineering and Department, said in a press release.The American Dental Association (ADA) states on their website that "The formerly practiced paradigm of 'drill and fill,' drilling out pits and fissures or surgically removing decayed and diseased tissue and placing permanent restorations, does not address the full continuum of the caries disease process, including microbial activity and the balance between enamel remineralization and demineralization."Although it's still in development, researchers anticipate this new treatment will be used in both public and private health settings.This treatment could eventually be incorporated into toothpastes, gels, and other dental care products as a safe, healthy alternative to current dental treatments and procedures that can be used by adults and children.Instead of treating cavities as they appear, this technology may enable people to prevent them by rebuilding and strengthening tooth enamel every day as part of their dental care routine.However, Lal cautions "Cavities being treated with biogenic approaches would require careful and frequent monitoring by a dental professional and should be validated by clinical trials prior to responsible use in the patient population. Home care should not be recommended until further investigation of all the potential risks of this treatment have been ascertained." 1 How Many Lakhs Does It Take to Make a Crore? 2 What Do You Call a Person Who Studies Dinosaurs? 3 Stay Up-to-Date in 2021 With These Custom Photo Calendar Ideas 4 A Summary of Roe v. Wade: The Landmark Ruling & Its Legacy Explained 5 What Is Scale of Preference in Economics? Your windshield is at risk for damage from any number of flying objects, such as rocks, hail, animals, or debris from a passing truck. Even a small crack or chip in your windshield should be repaired right away, so that it doesn't spread and cause further damage to your car, your passengers, or yourself. If your windshield is damaged, will you have to pay to have it replaced? Or is your cracked or chipped windshield covered by your car insurance? The answers depend on what type of car insurance policy you have. Comprehensive coverage will typically cover windshield damage. Some policies have an add-on called full glass coverage, which pays for windshield damage with no deductible. Some insurance companies waive the comprehensive deductible for glass damage. Comprehensive insurance coverage covers damage to your vehicle that wasn't caused by a collision. (That's why it's sometimes called "other than collision" coverage). These include: Theft Vandalism Fire Glass damage Animal damage Weather damage Falling-object damage For your windshield damage to be covered by comprehensive, you'd need to have added comprehensive coverage to your policy before the incident occurred—you can't add it after the fact. Find out if you have comprehensive coverage on your vehicle by checking your declaration page, calling your agent, or filing the claim and speaking with an adjuster. There is also an optional insurance add-on called full glass coverage, which may be offered through your insurance company. This coverage saves you from paying a deductible for a glass claim. It's not available in all states, and as it's an optional coverage, you may not have it. It also may have a slightly different name, such as Zero Dollar Glass Deductible. But if you did decide to purchase full glass coverage, you won't have to even pay the deductible for repairing or replacing your windshield: your glass claim is covered in full. Generally, there are two solutions to damaged glass: repairing the chip or crack, or replacing the entire windshield. Leaves factory-installed windshield seal in place Takes only 30 minutes or so Best for small breaks that aren't directly in front of the driver Costs more than a repair May be required due to extended damage or location of damage Comprehensive insurance typically requires a deductible, although you often have some choice in how much it is when you sign up. Generally, the lower the deductible, the higher the cost of insurance. Some insurance companies even offer no-deductible insurance. Check your policy to see what your deductible is for comprehensive claims. Your insurance company typically will only pay repairs beyond the cost of your deductible. Sometimes, an insurance carrier will require a deductible on comprehensive coverage but will waive that deductible specifically for glass damage. Other companies waive the deductible for glass repairs, but not replacements. You should find out whether your carrier waives deductibles for glass claims before deciding whether to file. Some states even require that a deductible not be applied in case of glass claims. In those states, you may be able to get your glass repaired or replaced without having to pay your deductible. If the cost of repairs is greater than your deductible, you should consider filing a claim. If you're hesitant because you don't want your insurance rates to go up, know that filing a claim won't necessarily affect your premium. Insurance carriers typically add a surcharge to policies that make claims due to something within your control, such as moving violations, not things out of your control. Usually, repairing a windshield doesn't signal risky driving behavior in the way that, say, an at-fault accident would. If you're simply too short on cash to pay your deductible, you may try putting off your repair until you can save up the money. However, repairing your glass in a timely fashion is important, not to mention you could receive a ticket if a police officer catches you with a cracked windshield. The sooner you file your claim and arrange for the work to be completed, the sooner your damaged windshield can be repaired or replaced. A small chip can spread, turning into a large crack over time and requiring a full windshield replacement. If you have a small chip in your windshield, you may be able to get it repaired quickly, at your home or office, at no out-of-pocket cost, provided you have comprehensive coverage. That beats waiting until a little problem becomes a big problem, possibly requiring a full replacement and paying a deductible. If you have a bare-bones policy with personal liability and property damage (PLPD) coverage only, you will have to pay to repair or replace your glass on your own. Make sure you learn about your car insurance coverage before the time comes to file a claim.
