Speed and agility are two of the most significant components of athletic and sports success. Being able to react instantly, quickly apply strength in any direction, and redirect that force as necessary is the sign of a real athlete. The ability to change direction due to internal or external information without the loss of speed is what we call agility. The agility and multidirectional training of speed often imitate the actual sports movement that a player engages during the game time. The key components of agility training are: Body control and awareness Recognition and reaction Start and first step Acceleration Feet change of direction Stop Meet the agility scale A great training tool covering each of these seven components is the agility scale. An agility scale is a multi-pneum scale made of rope or plastic and nylon. It is located on the floor to provide a stepping platform type hopscotch. The stairs can also be drawn on the floor with a piece of plaster. Agility Ladder Benefits The agility scales are cheap, lightweight and extremely portable. You also want a staircase that has disposition to attack it on the ground so that it does not move out of place if accidentally kick it. When using the internal scale, you may want to use small weight plates to hold it in place. The number of rungs on the scale is an important consideration. You want the length of the ladder to be quite challenging not to exaggerate. A 15-foot scale will give you a lot of frogs. If it is too long at first, simply double the number of rungs in half.
