TL;DR With the release of the Moto Z3, Motorola has satisfied its commitment to the concept Moto Mod. However, the company claims that Moto Mods will continue to be part of its ongoing mobile strategy. The company also said that the 5G Moto Mod presented yesterday will not be the last Moto Mod. When Motorola brought the first set of Moto Mods to the masses, he made a clear promise: the company would have supported Moto Mods for the length of three generations of devices. Yesterday, Motorola launched the Moto Z3, which supports Moto Mods, and will be the exclusive device to support the 5G Moto Mod. With that launch, the company has satisfied its three promised generations. Luckily for Mod fans the world around the world, which does not mean that Moto Mods now will become a thing of the past. According to Engadget – who spoke with Gaurang Telang, the product manager of Motorola’s flagship devices – Moto Mods “absolutely” will be a part of the company’s ongoing mobile strategy. New 5G Moto Mod will arrive at the beginning of 2019, connect the Moto Z3 network to 5G (Updated) Telang further clarified that 5G Moto Mod will not be the last Mod. Engadget, unfortunately, has not been able to obtain definitive information on what types of other Mods are on the way, when they will be released, or how often they will be launched. But everyone within Motorola said that the company is dedicated to Mods and will continue to push the innovative concept. While this is all good news, there is some warning. Shakil Barkat – Global Product Development VP – admitted that most Mods things could do had already been covered. This means that while the 5G Moto Mod may not be the last new Mod we see, there may not be many Mods that will be really unique as the 5G Mod. What do you think? Are you a great fan of the Moto Mod range and so you’re happy to hear that they’re not going anywhere in a short time? Or don’t you care about Moto Mods? Let us know in the comments! NEXT: The complete list of current and future Moto Mods While we have seen many smartphone manufacturers look for and not sell smartphones with “modular” hardware features, Motorola seems to have been the most successful with its Moto Mods. Okay, they may not be technically “modular” accessories since they stick to the back of the Moto Z phones via magnets, but it’s the next best thing, and these Mods really work well. The only negative aspect is that Moto Mods is beginning to become rare and seems to be slowly phasing out of existence. The most recent phones no longer support them, and the official Moto Mods site also offers just some options, and are in clearance. With this saying, those of you rocking a Moto Mods support phone can still find some of them online. Here is a quick look at the best Moto Mods that you can buy right now. The best Motosavailable: What phones do they work with Moto Mods? This is a rather solid base, consisting of telephones released in 2016, 2017, 2018 and 2019. If you have someoneYou can take advantage of the MODS MODS listed below. If you are interested in buying one, we advise you to get the last Z4 motorcycle, which is still quite convenient and offers a great quality relationship - price for your money earned. 1. 5G Moto Modverizon started selling the 5G Moto Mod even as he was just starting to unroll his 5G network. Now, if you want to take advantage of 5G Blazing-Fast speed with the Z3 motorcycle and Moto Z4, you will have to get this add-on. Other: the best 5g phones that can be purchased at this time this Moto mod incorporates the Qualcomm Snapdragon X50 modem for 5G network connection, and also has its 2,000m ah battery inside. It is expensive for an accessory, but it’s a better way to go if you already have the Moto Z3 or Z4 and you don’t want to update to a 5G smartphone even more expensive. 2. Motorcycle projector Insta-Share The projector contains a 1.100mAh battery and a 50-lumen projector that should last about an hour at full load. It is also supplied with a foldable rigid support that allows the image from the projector to be placed on any surface. The image projected by motion mod can rise up to 70 inches at a 480p resolution on a wall. 3. JBL SoundBoost 2 Speaker The 2017 successor of the original JBL Moto Mod Speaker, this new version is available in two different colors (red and blue) and has a more rounded shape than the 2016 edition. Apart from this, 1 Speaker still has 1,000m ah battery, which should allow him to last up to 10 hours, and a built-in tripod. Update: The best Bluetooth speakers for all budgets 4. Motorcycle battery case There are quite a bit of Moto Mods battery available for Moto T phones, but it’s always good to get the Manufacturer option. Motorola’s battery custody comes with a 2,220m Ah battery and a thin profile that is not advertising. 5. Wireless Tumi Charging Power Pack The Moto Tumi Z Battery Mod helps add up to 22 hours of battery life to the Moto Z family. But it is a standout function compared to other battery packs because it can also be uploaded to wireless mode . Essentially, this battery change adds wireless charging to the mix by adding that the support is for the phone and the battery pack. Related: The best portable chargers 6. Motorcycle 360 Camera As suggests the name, this Moto Mod camera will add a 360-degree sensor to any Moto Z device, allowing users to create 360 degree and video images designed to be viewed by reality headphones virtual. It has two 13MP cameras with support for 360-degree 4K video intake at 24FPS. It can also request videos and images of 150 degrees that will be perfect for extra-wide selfie. 7. Moto Gamepad This is perhaps the bike more expected of all time. The gamepad motion The Moto Z device in a portable game console similar to PlayStation Vita. Add Dual control sticks, a D-pad and four touch action buttons to the device, and also includes its 1,005m ah battery that should offer the owners up to eight hours of play. Here: the best Bluetooth game controllers for mobile devices and e 8. Moto Smart Speaker with Amazon Alexa This speaker is similar to the two JBL SoundBoost Moto Mods but adds support for Amazon’s Alexa Digital Assistant. It includes four remote field microphones that can pick up voice commands from the owners and handle everything Amazon Echo speakers can do. You can ask for it to give you news and weather reports, play your favorite songs, remember your calendar appointments and more. 9. Polaroid Insta-Share PrinterPutting this Moto Mod on the back of your phone model will allow you not only to take photos with its physical camera button, but then also instantly prints any photo you take with the Moto Mod à or any image you can access online on your phone, for that matter. You can also apply filters and other photo effects to images before printing them. Next: The best mobile photo printers Photos are printed as 2-inch prints using Zero-Ink Paper, with adhesive backs. This allows these photos to be placed almost anywhere you want. The Polaroid Insta-Share Printer contains 10 sheets of Zero-Ink paper, and the built-in 500mAh printer battery should handle 20 prints for a single charge. 10. Moto Stereo Speaker This new Moto The Mods input from Motorola is the Stereo Speaker add-on. Like the JBL brand Moto Mod speakers, this product crashes into the back of a Moto Z phone for a better audio experience, and also includes a built-in stand. The biggest difference between the two is that the Moto Stereo Speaker doesn’t have its own internal battery, which means the phone’s battery is powering this Moto Mod. JBL Moto Mod speakers have their own internal battery. Wow, look at the antenna hump on that Moto Z3 5G Mod? I haven’t seen anything like it since my dad’s Nokia 610. But credit to Motorola, the company has shape when it comes to awesome antennas. Who remembers the world’s first mobile phone à Motorola DynaTAC? Smartphones aren’t such a fan of this look these days and the fact that the industry’s first piece of consumer 5G equipment is so bulky is a sign to say and worrying. We are used to our smartphones which are sleek, slim and comfortable to hold. This research hasn’t been without its victims, like the headphone jack, but overall, people want their phones to be good when they spend big dollars. The Moto Z3 with the 5G Moto Mod attached certainly isn’t slick and it looks like the first 5G smartphones will be bulky enough if they’re to fit the needed antennas and bigger batteries in them. If this is the case, the Mod Moto Z3 could actually be the most elegant solution. Don’t miss: Moto Z3 hands-on: Our first look at a future 5G Why it needs The 5G transition will see the introduction of a lot of new network spectrum combine together to increase the speeds. New low frequency antennas, such as the 600MHz spectrum of T-Mobile and the Wi-Fi sub-6GHz channels integrate integrate smartphone without a major aesthetic overhaul. Although the move to larger array MIMO antenna presents some design considerations, we’re already using these technologies in today’s phones. The vector aggregation technology will only be scaling up with 5G. Qualcomm’s first 5G antennas are here: Here’s what you need to know However, mmWave high frequency technology is different. It requires not only a new antenna design, but also very careful antenna positioning considerations. Most materials, including the device case, block and attenuate mmWave signs. Worse, the hand you hold the phone with can completely block these waves. Poking this antenna outside the phone is a short-term job. What sacrifices will be made so that phones can fit multiple 5G antennas within their thin form factors? The QTM052 is very compact, but it certainly isn’t as thin as the small antenna lines you’ll find somewhere on your current phone. Also, Qualcomm notes that you want three or more of these inside a regular phone to avoid signal blocking, or four for a mobile hotspot. The Moto Mod moves away with just one because of its external positioning. How do they say that 5G smartphones for the 2019 release adapt to this technology inside without compromising their aesthetic design or other features? Careful antenna positioning has potential implications for thin-edge displays, under fingerprint display scanners, volume rocker positioning, speaker and camera positioning, and perhaps more. Then there’s the extra cost. A phone with three 5G antennas A phone with three 5G antenna positions to avoid signal blocking. Fitting these inside will be a bigger challenge than the 5G Mod of the Moto Z3. The interior space of the smartphone is at a premium and 5G antennas pose a problem there, but it gets worse. The 5G mmWave technology is also hungry for power and this means that future phones will require larger batteries too. Where’s everything going to be okay? The Moto Z3 5G Moto Mod includes an additional 2,000m Ah battery capacity to boost the already reasonable 3,000m Ah laptop cell. The implication is that about 5,000 m Ah battery will offer a decent battery life for a 5G phone. The faster data speeds use more juice. As Motorola puts it on its website when it comes to the capacity of the Mod battery, àDon’t slow down while the data restarts.à We’ll need 5,000-foot Ah batteries to power 5G phones? It is possible that the Mod is overly generous with this extra simple capability because it can fit inside the accessory without making it bigger than it needs to be. Be lenient and estimate that a powerful top 5G smartphone requires a small 4,500m Ah This is still significantly larger than the average capacity of the 2018 peak battery of about 3,400m Ah. This works at a 32 percent increase in the required battery area within an average phone or an equivalent increase in the density of the power area, neither nor which are plausible at the moment. 5G phones require much larger batteries to last the day and that almost certainly also mean thicker designs. That’s the problem with 5g what is 5G, and what can we expect from that? There’s a reason why Qualcomm’s 5G smartphone prototype, in the photo above, is so bulky and why Motorola is debuting 5G as a mod before rather than integrating the technology into the Moto Z3 itself. 5G requires more additional antennas and a bigger battery than ever before. Early 5G smartphones are probably bigger and heavier and more expensive or sacrifice other features to fit these components, or offer a compromised 5G experience with weak signals and/or low battery life. Only in the next few years, modem and antenna The technologies for 5G mmwave will undoubtedly be further reduced. Trends suggest that battery capacity is also on the rise, with 3,500 to 4,000 mAh becoming the norm over the next two years. Once that happens, 5G smartphones will definitely be more practical to build. Until then, you might want to keep out early adoption if you like your smart smartphones and with battery life that lasts all day. day.
