# Melanoma treatment guidelines

melanoma is an aggressive form of cancer that can be the threat of life. generally affects the skin, but it can also occur in the mouth, eyes, or under the nails. each has some moles, brown spots and birth signs, but people with more than 100 molecules are at greater risk of developing melanoma. early signs often appear in atypical moles and develop slowly over time. melanoma often begins with a healthy skin change, as a darker point or abnormal neoplasia. normal molecules are round and symmetric. molecules that are not symmetries are one of the first warning signs of melanoma. people prone to moles and other points should regularly check their skin for new or strange places. the boundaries of aggressive tumors are generally irregular, noted, or ragged. On the contrary, the edges of non-malignant tumors are usually smooth and regular. Moreover, any change in the surface of a mole is a sign of notice. shallotness, oozing, bleeding, or appearance of a lump or bump should be inspected, as should any redness or a new swelling beyond the edge of the mole, or spread of pigment from the border of a point in the surrounding skin. uniform color is usually a sign of a healthy mole. melanomas tends to develop a variety of colors, especially shades of black, brown and tan. can also be blue, red, white or pink. If a mole suddenly changes color, or is painful and does not heal for a long time, this should ask an individual to seek medical attention. Healthare generally small and flat. They do not cause pain, itching, or any other feeling. In general, the moles larger than about a quarter of inch — the size of a pencil eraser — could indicate a melanoma if other features, such as the edges and shade of the color, are also problematic. A great sign of birth does not mean melanoma, but if it begins to develop an irregular edge or a different color, or lose its symmetry, a doctor should investigate. However, even the smallest moles can be problematic, which is why looking for various alarming signs and changes is important. Common and benign moles look the same over time. They could get a little darker during the summer, but usually do not change shape, color, or symmetry. Be alert when a mole begins to evolve or change in any way. Any change in size, shape, color, elevation, or other trait is suspicious. Be careful when a mole begins to bleed, itching, or crust, when the feeling changes, or if the pain develops in the area. Sometimes, skin melanomas are incredibly itching. Apples that suddenly begin to cause a lot of irritation to the surrounding area should require a visit to the doctor or dermatologist. Conditions other than skin cancer, such as allergies and eczema, may also cause skin itching. However, if itching is concentrated around a particular amount, it is a good idea to get it checked. Healthy moles should not be painful or uncomfortable. See a doctor as soon as possible when any mole begins to hurt for no oneespecially if problematic growth has any of the other characteristic signs of melanoma, such as itching or a recent change of color, size, or symmetry. Sometimes, melanoma develops in the eyes. Symptoms differ slightly from those of skin melanoma. Cancer can only be in the eyes, or it can spread in another location, most commonly the liver. Too much exposure to sunlight is a significant risk factor for melanoma, and people with the right skin and blue eyes are more affected. Symptoms of eye melanoma include swelling eyes, iris color changes, poor vision in the affected eye, and red, swollen or painful eyes. Subungual melanoma is skin cancer under the nail, and is relatively rare. People of African American heritage, and other people with darker skin pigments, are the most often affected people. The first indication of subungual melanoma is usually a brown or black color, which is often mistaken for a bruise. If caught in advance, recovery rates for this type of melanoma are quite high. A biopsy can confirm the diagnosis; Doctors can remove or soften the nail to remove a segment of skin to send to a pathologist. The cancer of the mouth or oral cancer occurs when a tumor develops on the surface of the tongue, mouth, lips or gums. Tumors can also occur in salivary glands, tonsils and pharynxes, the part of the throat that leads from the mouth to the suction cup, but these positions are less common and usually occur as part of a syndrome. Symptoms of melanomathe mouth includes red or white spots on the lining of the mouth or tongue, ulcers, lumps and pain while eating and swallowing. Oral pigments may also occur, ranging from light brown to black, red, or violet. Like skin melanomas, they are usually multiple colors. Melanoma is a skin cancer that can appear on the skin in many ways. It may seem like a mole:Changing Spot that looks like a new mole, freckles, or age point, but it seems different from others on your skinSpot that has a jagged edge, more than a color, and is growingThe growth in dome shape that feels solid and can look like a wound, which can bleed Dark-brown or black vertical line under a nail or an increasing skin band This first melanoma could be wrong for a mole, so it is important to look carefully at the points on the skin. ABCDEs of melanoma To help people find a possible melanoma on their skin, dermatologists have created the ABCDEs of melanoma: A is for AsymmetryA half of the place is different from the other half. B is for BorderThe place has an irregular edge, scalloped, or undefined. C is for ColorThe spot has different colors from one area to another, such as tan shadows, brown or black, or areas of white, red, or blue. D is for DiameterWhile melanomas are usually larger than 6mm, or about the size of a pencil rubber, when diagnosed, can be smaller. And it's for EvolvingThe spotdifferent from the rest or is changing in size, shape or color. If you find a point on your skin that has any of the ABCDEs of melanoma, see a certified dermatologist on board for a skin examination. The following images can help you see how the ABCDEs of melanoma can look on the skin. Photos of melanoma How many ABCDEs can you find in the following melanoma images? You want to trade these melanomas for odd harassment? Both show the A (asymmetrical form) and the B (cross-border) of the melanoma. The melanoma on the right shows the C (various color). Melanoma often contains shades of brown, black or brown, but some may be red or pink, such as the one shown here. And yet you can see some of the ABCDEs here. The point shows the A (asymmetrical form) and B (irregular boundary). Melanoma can spread as it grows, but this is growing and seems a constant and growing growth. Have you noticed the A (asymmetrical form) and B (irregular corridor)? This melanoma is spreading as it grows. Have you noticed the A (asymmetrical shape), B (irregular boundary), C (color variety), and D (diameter is bigger than a pencil rubber)? Melanoma that could be wrong for a common skin problem Melanoma can develop anywhere on the skin, including the bottom of the foot, where it may seem like a bruise as shown here. This reddish nodule looks a lot like a cyst, but the tests showed it was a melanoma. In people of African descent, melanoma tends to develop on the palm, on the bottom of the foot, or below or around aHave you noticed asymmetry, irregular edge, variant color and larger diameter than a gum? Melanoma can develop under a nail or nail, as a brown line as shown here. While this line is thin, some are much thicker. The lines can also be much darker. Does melanoma hurt? You may have melanoma without feeling any pain or discomfort. For many people, the only sign of this skin cancer is a point that has some of the melanoma ABCDEs or a line under a nail. Sometimes, melanoma causes discomfort. Can How do people find melanoma marks on their skin? Perform a self-exuma skin as often recommended by your dermatologist is the best way. During the skin examination, you want to look for the following: Mole (or other point on the skin) that is changing in any way Spot that seems different from the rest of the spots on the skinGrowth or spot on the skin itching, bleeding, or is painfulBand of color below or around a nailSore that does not heal or heal and returns Melanoma ABCDEs can help you find changes to a mole, freckles, or other place on the skin. Tools that can help you find melanoma on your skin To help you find melanoma soon, the American Academy of Dermatology has developed the following: How to make a skin self-examination This short video shows how you can examine the skin for skin cancer signs. Map of body size Use this diagram to draw the moles and other points on the skin so you can locate a change soon. Quiz:melanoma on your baby's skin? Melanoma can look different on the skin of a child. Taking this short quiz can help you refine your skills in finding child melanoma.
