Why is my radiator leaking transmission fluid

It is extremely important to keep the transmission fluid of your car from being too low, since the failure of this tool could cause any number of problems with vehicle performance. The transmission fluid is a fluid that is used to lubricate all mobile parts within the transmission system of your car. In addition to lubricating the transmission, the fluid also helps to cool the system components and assists in the transmission of power from the engine to the transmission system. If the car transmission fluid becomes too low, it usually means it has a loss in its transmission system. This is because the transmission fluid does not burn gradually, like engine oil. It can be lost only through loss. So, if you discover that the transmission fluid is becoming unusually low quickly, you should check your car for losses. If the transmission fluid of the car becomes too low, it can cause serious damage to the entire transmission system, and possibly force to eventually get the transmission replaced. As the transmission fluid acts as a lubricant, the transmission components will begin to grind against each other without it. This causes metal pieces to be mixed with the remaining liquid and gradually degrades the system. Heng kong Chen image hydraulic machine control lever from Fotolia.com Hydraulic systems such as the braking system of a vehicle are systems that operate, move or are affected by a fluid. Depending on the system, the fluid can be water-basedbased on oil. Hydraulic fluid is a means that transmits power in a hydraulic system. Viscosity, wear protection, oxidation stability and foam resistance are typical factors that determine the type of hydraulic fluid. The viscosity of the fluid must correspond to the operating temperature of the hydraulic system. The transmission fluid is the oil that lubricates the moving parts within the transmission. Automatic transmissions also use the fluid as a refrigerant. The transmission fluid is designed for automatic and manual transmissions. Due to the thermal operation of the transmission generates, automatic transmission fluid degrades and breaks with use. The transmission fluid is a type of hydraulic fluid. The transmission fluid is a medium that transmits power from the motor to the transmission. Other types of hydraulic fluid include mud engine oil and conventional hydraulic oil wear. Jupiterimages/Photos.com/Getty Images The transmission fluid can be surprisingly colorful, especially if you've never seen it before and you don't know what to expect. The transmission fluid color is one of the best early warning signs of transmission problems, so it is important to check your fluid or make it check as part of your regular vehicle maintenance program. The transmission fluid should be changed every two or three years, or 24,000 to 36,000 miles. If the transmission fluid in your car is pink, red or even very light brown-reddish, the transmission fluid is just fine. These are theYour transmission fluid should be. there are a variety of different brands of transmission fluid, which represents the change in shadow, but overall your transmission fluid should have a reddish color to it. the new brand fluid will be lighter than color than liquid that was in your car for a year or two. dark brown or black transmission liquid is a sign of old or burned transmission liquid. If your fluid is dark brown or black, it needs to be changed, and your transmission must be controlled for problems to make sure that you do not overheat and burn the liquid. Your transmission fluid should be translucent. the dark transmission fluid, cloudy, creamy, milky or matte is a sign of a problem with transmission. Sometimes this is caused by the cooler being forced into the transmission by a faulty radiator. can also be caused by water or debris in transmission. If the transmission fluid is not clear/translucent, you must bring your car to a transmission specialist and determine why. At least, the transmission fluid must be changed. photo: shutterstockrealize that your vehicle is dripping a sort of mysterious liquid is very creepy. Maybe it's nothing, or maybe you're going to face a expensive visit to the mechanic. the good news is that it is not too difficult to decipher these points and tell if the fluid loss is a harmless drop or a serious problem to solve as soon as possible. That's how. There are three things to consider when it comes to thoselosses: color, consistency and position (so it can be said if the loss occurred from the front or back of the machine). For the latter, The Car Guy says that you can place newspaper or aluminum sheet under your car in the evening and then "read" the stains the next day. In this way, it can be said if the loss is fluid steering of power (reds star or light brown, from the front of the car) compared to the automatic transmission fluid (also often reddish or light brown, but dripping from the center of the machine). Screening: All summer The above infographic, from Allstate, is a convenient reference guide to six common puddle cars that you might encounter. For example, if the drop is reddish or light brown and thin, then it is probably fluid steering power. But if it is brown and often, then it is probably transmission fluid. Transparent liquids could be one of two things: if it is thin, then it is probably water. But if it's sleigh, then it's probably brake fluid. The brake fluid is one of the most dangerous losses to worry about, as Jalopnik emphasizes. If you see that clear to brown and slick puddle under your car (it will be even more slippery to the touch than engine oil or transmission fluid), don't even try to drive it, but get it drawn immediately. As the Art of Manliness says: the braking system of your car works on a hydraulic pressure system. The brake fluid serves as a hydraulic fluid that maintains that pressure. A loss of brake fluid will cause a pressure drop, possibly resulting in brake failure. This is not something youto happen as you are crossing Dead Man's Hill that goes 60 MPH. Fortunately, in most modern cars, brake fluid losses are rare. If you have one, you will usually find it near the wheels or in the area directly under the brake pedal. Know these losses and repair them if necessary can help to avoid more expensive repairs down the line (such as replacing a grind-down transmission). It is also something you should do before any trip.
